Mie scattering 1

Mie scattering

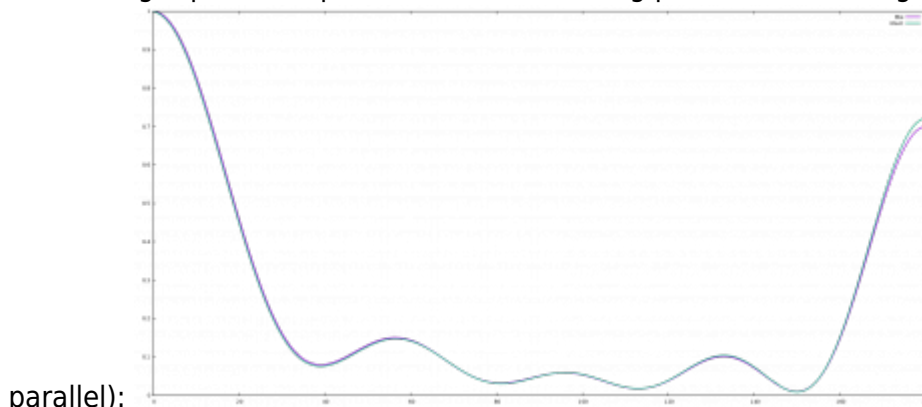

Scattering of monochromatic light by a homogeneous dielectric sphere is a traditional problem in the area of light-matter interaction. It has numerous applications, e.g. in aerosols measurements in environmental studies.

Calculation on a regular, smooth and homogeneous, sphere can be done using Mie's solution of Maxwell equations and there are numerous codes available for this, even [online](#). However, we can use it to benchmark the performance of the near-field to far-field transform.

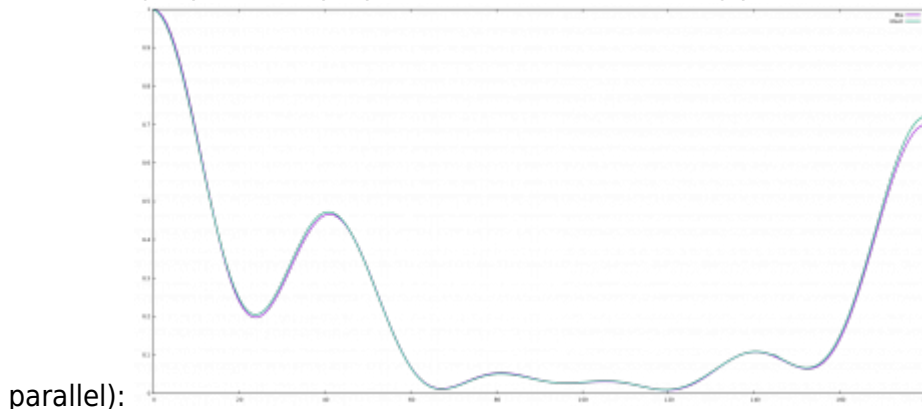

The figures below illustrate a good match between GSvit and Mie's solution calculated using the [MieScatter](#) package for Julia.

Nominal particle radius: 400 nm, wavelength: 633 nm, refraction index of the sphere material: 2.0.

Incident light polarized parallel to the scattering plane (scattered light therefore also polarized

Incident light polarized perpendicular to the scattering plane (scattered light therefore also polarized

Under construction.
